

Equations from Data

How fast can you and your classmates pass a textbook from one person to the next until the book has been relayed through each person in class?

14 students

1. Suppose your entire class lined up in a row. Estimate the length of time you think it would take to pass a book from the first student in the row to the last. Assume that the book starts on a table and the last person must place the book on another table at the end of the row.

Estimated time to pass the book: 25 sec.

Notes
Section

2. As a class, experiment with the actual time it takes to pass the book using small groups of students in your class. Use the table below to record the times.

Number of Students Passing the Book	3	6	9	11	13	14
Time to Pass the Book (nearest tenth of a second)	4.1	6.5	7.6	7.8	9.1	9.4

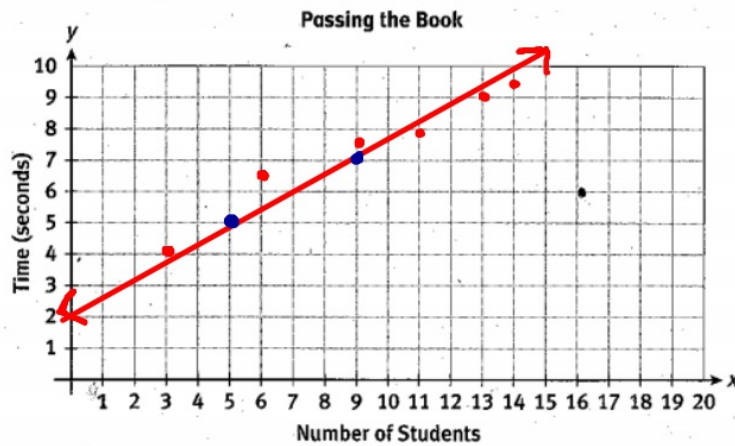

Volunteers!

3. Based on the data you recorded in the table above, would you revise your estimated time from Item 1? Explain the reasoning behind your answer.

Yes, we moved at a quicker pace.

4. Graph the data in your table from Item 2 as a scatter plot on the coordinate grid.

Notes
Section

5. Are the data that you collected linear data?

a. Explain your answer using the scatter plot.

YES, OUR DATA RESEMBLES A LINE.

b. Explain your answer using the table of data.

AS THE NUMBER OF STUDENTS INCREASES, THE TIME INCREASES.

Notes Section

6. Describe how the time to pass the book changes as the number of students increases.

7. Work as a group to predict the number of seconds it will take to pass the book through the whole class.

a. Place a **trend line** on the scatter plot in Item 4 in a position that your group feels best models the data. Then, mark two points on the line.

b. In the spaces provided below, enter the coordinates of the two points identified in Part (a).

Point 1: (5, 5) Point 2: (9, 7)

c. Why does your group think that this line gives the best position for modeling the scatter plot data?

Our trend line evenly passes through the data points.

Notes Section

8. Use the coordinate pairs you recorded in Item 7(b) to write the equation for your trend line (or linear model) of the scatter plot.

9. Explain what the variables in the equation of your linear model represent

$$(5, 5) \quad (9, 7)$$
$$m = \frac{7-5}{9-5} = \frac{2}{4} = 0.5$$
$$y = 0.5x + 2.5$$

$$y = mx + b$$
$$5 = 0.5(5) + b$$
$$5 = 2.5 + b$$
$$\frac{-2.5 \quad -2.5}{2.5 = b}$$

$x = \#$ of students
 $y = \text{time}$

10. What is the meaning of the slope in your linear model?

The time to pass the book increases by 0.5 seconds per student.

11. Use your equation to predict how long it would take to pass the book through all the students in your class.

Predicted time to pass the book: 10 sec.

$$y = 0.5x + 2.5$$
$$y = 0.5(15) + 2.5$$
$$y = 10$$

12. Using all of the students in your class, find the actual time it takes to pass the book.

Actual time to pass the book: 8 sec.
